The vegetable garden

Agricultural gardens are an effective tool for the promotion of environmental experiences, which aim to awaken an ecological conscience through daily activities that bring agriculture closer to people from an early age.

In this way, the elaboration of vegetable gardens is a useful pedagogical tool of the Learning by Doing methodology, where a practical experience is proposed to promote a change in the educational model. The objective of these activities is to create a multipurpose learning scenario, focused on a participatory, experiential and collaborative methodology for the development of scientific and social activities and providing an approach to agriculture in harmony with the various production processes.
